

A* Shortest Path Search

Course 4, Module 3, Lesson 3

UNIVERSITY OF TORONTO
FACULTY OF APPLIED SCIENCE & ENGINEERING

Recall: Dijkstra's for Weighted Graph

Euclidean Heuristic

- Exploits structure of the problem
- Fast to calculate
- Straight-line distance between two vertices is a useful estimate of true distance along the graph

$$h(v) = \|t - v\|$$

Euclidean Heuristic - Example

Admissible heuristic
($h \leq \text{true cost}$)

$$h(a) = \sqrt{2^2 + 2^2} = 2.828$$

road segments
are not straight line paths

A* Algorithm

Use heuristic to guide the search to the goal

A* Algorithm

Algorithm A*(G,s,t)

```
1.  open ← MinHeap()
2.  closed ← Set()
3.  predecessors ← Dict()
4.  open.push(s, 0)
5.  while ! open.isEmpty() do
6.     $u, uCost \leftarrow \text{open.pop}()$ 
7.    if isGoal( $u$ ) then
8.      return extractPath( $u$ , predecessors)
9.    for all  $v \in u.\text{successors}()$ 
10.     if  $v \in \text{closed}$  then
11.       continue
12.      $uvCost \leftarrow \text{edgeCost}(G, u, v)$ 
13.     if  $v \in \text{open}$  then
14.       if  $uCost + uvCost + h(v) < \text{open}[v]$  then
15.          $\text{open}[v] \leftarrow uCost + uvCost + h(v)$ 
16.          $\text{costs}[v] \leftarrow uCost + uvCost$ 
17.          $\text{predecessors}[v] \leftarrow u$ 
18.     else
19.        $\text{open.push}(v, uCost + uvCost)$ 
20.        $\text{costs}[v] \leftarrow uCost + uvCost$ 
21.        $\text{predecessors}[v] \leftarrow u$ 
22.   closed.add( $u$ )
```

A* Algorithm

accumulated cost
from start
total cost $g = f + h$
heuristic estimate
to the goal

1. **if** $v \in \text{open}$ **then**
2. **if** $u\text{Cost} + uv\text{Cost} + h(v) < \text{open}[v]$ **then**
3. $\text{open}[v] \leftarrow u\text{Cost} + uv\text{Cost} + h(v)$
4. $\text{costs}[v] \leftarrow u\text{Cost} + uv\text{Cost}$
5. $\text{predecessors}[v] \leftarrow u$
6. **else**
7. $\text{open.push}(v, u\text{Cost} + uv\text{Cost})$
8. $\text{costs}[v] \leftarrow u\text{Cost} + uv\text{Cost}$
9. $\text{predecessors}[v] \leftarrow u$

Example - Origin Node

Open Min Heap:

Node	Cost + Heuristic
s	4.472

Closed Set:

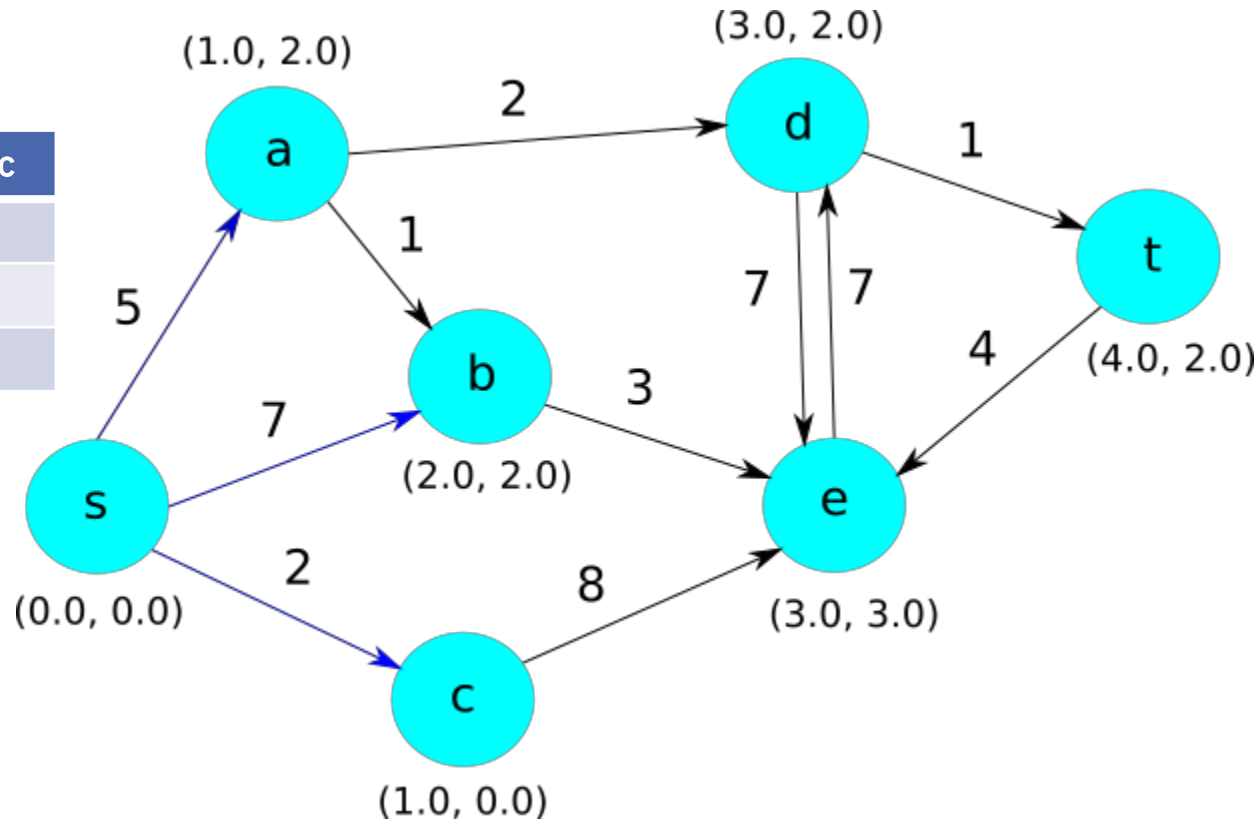

Example - Processing s

Open Min Heap:

Node	Cost + Heuristic
c	5.606
a	8
b	9

Closed Set: s

Example - Processing c

Open Min Heap:

Node	Cost + Heuristic
a	8
b	9
e	11.414

Closed Set: s
c

Example - Processing a

Open Min Heap:

Node	Cost + Heuristic
d	7
b	8
e	11.414

Closed Set: s
c
a

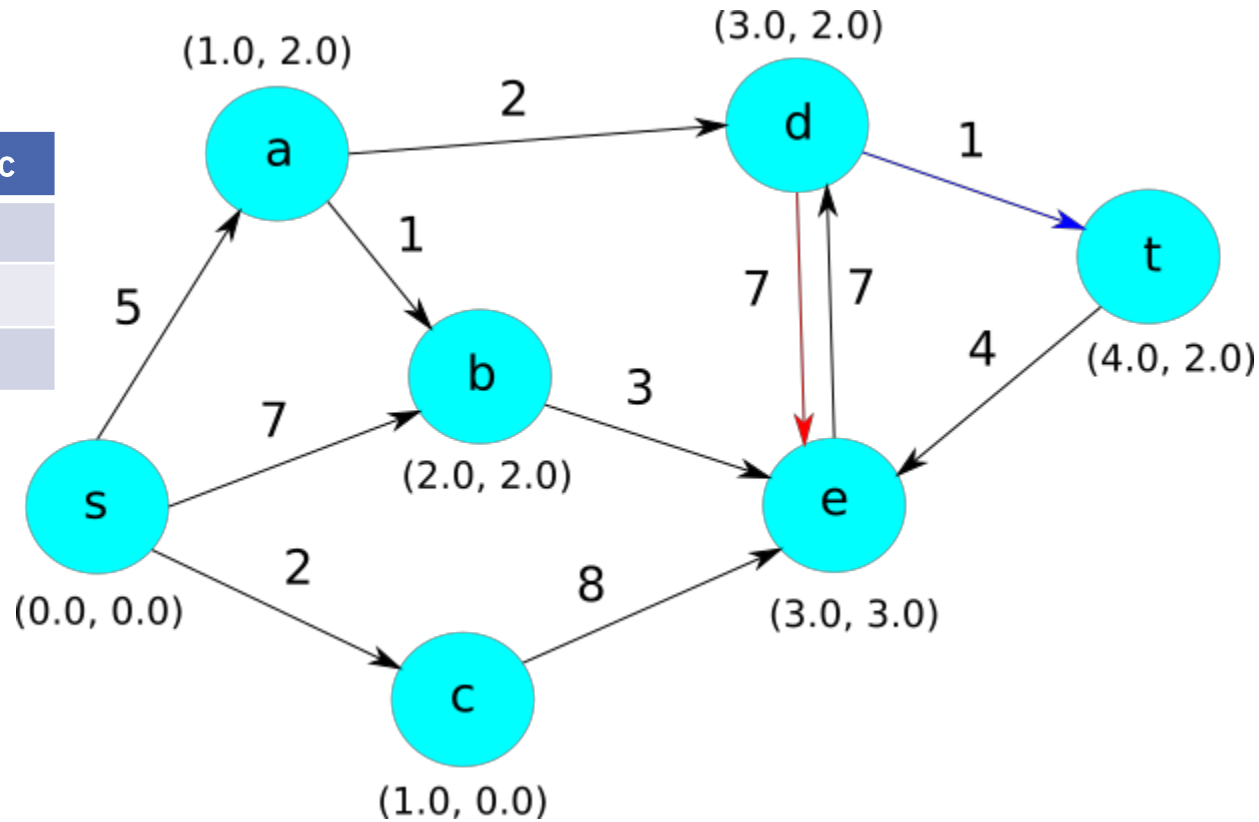

Example - Processing d

Open Min Heap:

Node	Cost + Heuristic
t	7
b	8
e	11.414

Closed Set: s
c
a
d

Example - Final Path

Final Path: s
a
d
t

Extensions to Other Factors

- Traffic, speed limits, and weather affect mission planning
- Time rather than distance is better at capturing these factors
- Replace distance edge weights with time estimates

Example

$$v_{max} = 100 \frac{km}{hr} = 27.7778 \frac{m}{s}$$

$$h(a) = \frac{\sqrt{2^2 + 2^2}}{v_{max}} = 101.82s$$

$$h(a) = \frac{\sqrt{2000^2 + 2000^2}}{v_{max}} = 101.82s$$

Euclidean distance

max speed

Example

$$v_{max} = 100 \frac{km}{h} = 27.78 \frac{m}{s}$$

$$h(a) = \frac{\sqrt{2000^2 + 2000^2}}{v_{max}} = 101.82s$$

Summary

- Introduced Euclidean heuristic, showed it was admissible to our mission planning problem
- Walked through the A^* search algorithm
- Discussed how to modify the heuristic to handle travel time rather than distance in our search
